## Git Bash

- ⇒ `.bashrc` - is executable file which runs when bash is opened and contains specifications
- ⇒ `.profile` - used to store env environment variables

### ⇒ Creating a bash script.

① Type "`$ vim testshell.sh`" to open a file in vim

② Press "Insert" key to go in insert mode

③ Enter following in the file:

```
#!/bin/bash  
echo "yashasvi"
```

④ Press escape to get out of insert mode.

⑤ Type `:wq` and press enter to save the file

⑥ Type `chmod 755 testshell.sh` to make the file executable

12 Sunday ⑦ Use `./testshell.sh` to execute the file

`$ git blame <File name>`

→ lists who, when changed files

\$ ls

→ list all files/directories

\$ cd home

→ go to home directory

\$ pwd

→ show path of current directory (print working directory)

\$ touch main.cpp

→ create file named "main.cpp"

\$ mkdir hello

→ make a directory named hello

\$ mv <filename> <dest.path>

→ moving a file to destination

\$ ls <folder name>

→ listing files inside a folder

\$ mv <old filename> <new file name>

→ renaming

\$ cat <file name>

→ showing contents of that file

\$ cat > input.txt <hello

→ Redirection

→ over-write hello inside input.txt file

\$ cat >> input.txt <hello

→ appending hello inside input.txt file

\$ cat < hello.txt

→ taking input from file or text

\$ cat < hello.txt > bye.txt

→ taking input from hello & writing to bye

Thu	04	11	18
Fri	05	12	19
Sat	06	13	20
Sun	07	14	21

\$ cp hello.txt bye.txt  
→ copy from hello.txt to bye.txt

\$ rm <file name>  
→ to remove a file

\$ rm -f <file name>  
→ remove file without confirming

\$ <command> --help  
→ to show command options for a command

\$ man <command>  
→ to open manual page of a command

\$ wc <file name>  
→ gives "No. of lines", "No. of words" and "bytes used".

\$ less <file name>  
→ shows file part by part (large files)

\$ head <file name>  
→ shows top 10 lines of a file

\$ tail <file name>  
→ shows last 10 lines of a file

09 Sunday

Linux

\$ cd ..  
→ go back to the parent directory

\$ touch <file name>  
→ creating a new file

\$ code hello.txt  
→ opening a file in java vs code

\$ clear  
→ to clear the terminal screen

Notes

Appointment

Notes

\$ mv

=> Pip

=> Imp  
err

\$ grep

\$ grep

\$ mv direc1 direc2

→ moving directory direc1 inside directory direc2

⇒ Pipes - A coding tool that allows the output of one command to be used as the input for a different command.

\$ cat file1.txt | wc -w

↑ pipes  
↓ output works as an input of

⇒ Input represented by '0', output by '1' and error by '2'.

Ex use 2> to send error to a file.

\$ ls -l /bin/usr > error.txt 2>&1

→ to store either output or the error in the txt file.

\$ grep Sam names.txt

→ to see words in files which contain "sam"

\$ grep ls -l | grep zip

→ searching in list of directories for "zip" using pipe
